## Outline

- Constrained optimization
- Reminder: integration of functions of 1 variable
- 2-variate function integration

## Motivation

Find the maximum and minimum points when walking along the black line:

## The problem

Let $f: \mathbb{R}^{n} \rightarrow \mathbb{R}$.
Find (local) maxima and minima of $f$ subject to

$$
\left\{\begin{aligned}
g_{1}\left(x_{1}, x_{2}, \ldots, x_{n}\right) & =0 \\
g_{2}\left(x_{1}, x_{2}, \ldots, x_{n}\right) & =0 \\
& \vdots \\
g_{p}\left(x_{1}, x_{2}, \ldots, x_{n}\right) & =0
\end{aligned}\right.
$$

Set $\mathcal{G}=\left\{\left(x_{1}, x_{2}, \ldots, x_{n}\right) \in \mathbb{R}^{n} \mid g_{i}\left(x_{1}, x_{2}, \ldots, x_{n}\right)=0, i=1,2, \ldots, p\right\}$.

## Assumptions

(1) The functions $f$ and $g_{i}$, with $i=1,2, \ldots, p$, have continuous second partial derivatives.

## Assumptions

(1) The functions $f$ and $g_{i}$, with $i=1,2, \ldots, p$, have continuous second partial derivatives.
(2) The gradients $\nabla g_{1}(x), \nabla g_{2}(x), \ldots, \nabla g_{p}(x)$ form a linearly independent set for all $x \in \mathcal{G}$.

## Assumptions

(1) The functions $f$ and $g_{i}$, with $i=1,2, \ldots, p$, have continuous second partial derivatives.
(2) The gradients $\nabla g_{1}(x), \nabla g_{2}(x), \ldots, \nabla g_{p}(x)$ form a linearly independent set for all $x \in \mathcal{G}$.

## Example

Are the gradients of the following functions linearly independent?

$$
\begin{array}{ll}
g_{1}(x, y)=2 x+x y^{2}, & g_{2}(x, y)=4 x+2 x y^{2}, \\
g_{3}(x, y)=2 x y^{2}+4 y^{2}, & g_{4}(x, y)=2 x+3 x y^{2}+4 y^{2} .
\end{array}
$$

## Running example

## Necessary condition

## Theorem

Assume $f$ has a local extremum in $x^{*}=\left(x_{1}^{*}, \ldots, x_{n}^{*}\right) \in \mathcal{G}$ subject to $\mathcal{G}$. Then there exist numbers $\mu_{1}^{*}, \ldots, \mu_{p}^{*}$ such that the Lagrangian function $L$ given by

$$
L\left(x_{1}, \ldots, x_{n}, \mu_{1}, \ldots, \mu_{p}\right)=f\left(x_{1}, \ldots, x_{n}\right)+\sum_{i=1}^{p} \mu_{i} g_{i}\left(x_{1}, \ldots, x_{n}\right)
$$

has zero partial derivatives with respect to $x_{1}, \ldots, x_{n}$ at the point $x^{*}$.
In other words, the following system is true:

$$
\left\{\begin{aligned}
& \frac{\partial f}{\partial x_{1}}\left(x^{*}\right)+\mu_{1}^{*} \frac{\partial g_{1}}{\partial x_{1}}\left(x^{*}\right)+\cdots+\mu_{p}^{*} \frac{\partial g_{p}}{\partial x_{1}}\left(x^{*}\right)=0 \\
& \vdots \\
& \frac{\partial f}{\partial x_{n}}\left(x^{*}\right)+\mu_{1}^{*} \frac{\partial g_{1}}{\partial x_{n}}\left(x^{*}\right)+\cdots+\mu_{p}^{*} \frac{\partial g_{p}}{\partial x_{n}}\left(x^{*}\right)=0
\end{aligned}\right.
$$

## Sufficient condition

## Theorem

Let $x^{*}=\left(x_{1}^{*}, \ldots, x_{n}^{*}\right) \in \mathbb{R}^{n}$ and $\mu^{*}=\left(\mu_{1}^{*}, \ldots, \mu_{p}^{*}\right) \in \mathbb{R}^{p}$ such that
(1) the Lagrangian function $L\left(x_{1}, \ldots, x_{n}, \mu_{1}, \ldots, \mu_{p}\right)$ has zero partial derivatives with respect to $x_{1}, \ldots, x_{n}$ at the point $\left(x^{*}, \mu^{*}\right) \in \mathbb{R}^{n+p}$;
(1) the Lagrangian function $L\left(x_{1}, \ldots, x_{n}, \mu_{1}, \ldots, \mu_{p}\right)$ has zero partial derivatives with respect to $\mu_{1}, \ldots, \mu_{p}$ at the point $\left(x^{*}, \mu^{*}\right) \in \mathbb{R}^{n+p}$;
(9.) for all non-zero $y \in \mathbb{R}^{n}$ satisfying $y \cdot \nabla g_{i}\left(x^{*}\right)=0$ for $i=1,2, \ldots, p$ we have

$$
y\left(\nabla^{2} f\left(x^{*}\right)+\sum_{i=1}^{p} \mu_{i}^{*} \nabla^{2} g_{i}\left(x^{*}\right)\right) y^{T}>0
$$

Thus, the function $f$ has a strict local minimum at $x^{*}$ (subject to $\mathcal{G}$ ).

## Sufficient condition

## Theorem

Let $x^{*}=\left(x_{1}^{*}, \ldots, x_{n}^{*}\right) \in \mathbb{R}^{n}$ and $\mu^{*}=\left(\mu_{1}^{*}, \ldots, \mu_{p}^{*}\right) \in \mathbb{R}^{p}$ such that
(1) the Lagrangian function $L\left(x_{1}, \ldots, x_{n}, \mu_{1}, \ldots, \mu_{p}\right)$ has zero partial derivatives with respect to $x_{1}, \ldots, x_{n}$ at the point $\left(x^{*}, \mu^{*}\right) \in \mathbb{R}^{n+p}$;
(1) the Lagrangian function $L\left(x_{1}, \ldots, x_{n}, \mu_{1}, \ldots, \mu_{p}\right)$ has zero partial derivatives with respect to $\mu_{1}, \ldots, \mu_{p}$ at the point $\left(x^{*}, \mu^{*}\right) \in \mathbb{R}^{n+p}$;
(9.) for all non-zero $y \in \mathbb{R}^{n}$ satisfying $y \cdot \nabla g_{i}\left(x^{*}\right)=0$ for $i=1,2, \ldots, p$ we have

$$
y\left(\nabla^{2} f\left(x^{*}\right)+\sum_{i=1}^{p} \mu_{i}^{*} \nabla^{2} g_{i}\left(x^{*}\right)\right) y^{T}>0
$$

Thus, the function $f$ has a strict local minimum at $x^{*}$ (subject to $\mathcal{G}$ ).
If we replace in (iii) the condition " $>0$ " by " $<0$ ", we obtain a sufficient condition of a strict local maximum.

## Example

## Example

Find maxima and minima of $f(x, y)=x+y$ subject to $x^{2}+y^{2}=2$.

## Integration of functions of 1 variable

Let $f: \mathbb{R} \rightarrow \mathbb{R}$ and $a<b$.

Recall what does $\int_{a}^{b} f(x) \mathrm{d} x$ mean, if it exists.

What is its geometrical meaning?

## Definition

Let $\Delta=\left(x_{i}\right)_{i=0}^{n}$ define a partition of $[a, b]: a=x_{0}<x_{1}<\ldots<x_{n}=b$.

## Definition

Let $\Delta=\left(x_{i}\right)_{i=0}^{n}$ define a partition of $[a, b]: a=x_{0}<x_{1}<\ldots<x_{n}=b$.

Set $F_{\Delta, i}=\max _{x \in\left[x_{i-1}, x_{i}\right]} f(x) \quad$ and $\quad f_{\Delta, i}=\min _{x \in\left[x_{i}-1, x_{i}\right]} f(x)$.

## Definition

Let $\Delta=\left(x_{i}\right)_{i=0}^{n}$ define a partition of $[a, b]: a=x_{0}<x_{1}<\ldots<x_{n}=b$.
Set $F_{\Delta, i}=\max _{x \in\left[x_{i-1}, x_{i}\right]} f(x) \quad$ and $\quad f_{\Delta, i}=\min _{x \in\left[x_{i}-1, x_{i}\right]} f(x)$.

The upper Darboux sum of $f$ with respect to the partition $\Delta$ is

$$
S_{f, \Delta}=\sum_{i=1}^{n} F_{\Delta, i} \cdot\left(x_{i}-x_{i-1}\right)
$$

and the lower Darboux sum of $f$ with respect to the partition $\Delta$ is

$$
s_{f, \Delta}=\sum_{i=1}^{n} f_{\Delta, i} \cdot\left(x_{i}-x_{i-1}\right)
$$

## Definition. . .

The upper Darboux integral (of $f$ over $[a, b]$ ) is

$$
D_{f}=\inf \left\{S_{f, \Delta}: \Delta \text { is a partition of }[a, b]\right\}
$$

and the lower Darboux integral (of $f$ over $[a, b]$ ) is

$$
d_{f}=\sup \left\{s_{f, \Delta}: \Delta \text { is a partition of }[a, b]\right\} .
$$

## Definition. . .

The upper Darboux integral (of $f$ over $[a, b]$ ) is

$$
D_{f}=\inf \left\{S_{f, \Delta}: \Delta \text { is a partition of }[a, b]\right\}
$$

and the lower Darboux integral (of $f$ over $[a, b]$ ) is

$$
d_{f}=\sup \left\{s_{f, \Delta}: \Delta \text { is a partition of }[a, b]\right\} .
$$

If $D_{f}=d_{f}$, we call this value the Darboux integral of $f$ over $[a, b]$, and denote it

$$
\int_{a}^{b} f(x) \mathrm{d} x=D_{f}=d_{f} .
$$

We say that $f$ is (Darboux-) integrable over $[a, b]$.

## Definition. . .

The upper Darboux integral (of $f$ over $[a, b]$ ) is

$$
D_{f}=\inf \left\{S_{f, \Delta}: \Delta \text { is a partition of }[a, b]\right\}
$$

and the lower Darboux integral (of $f$ over $[a, b]$ ) is

$$
d_{f}=\sup \left\{s_{f, \Delta}: \Delta \text { is a partition of }[a, b]\right\} .
$$

If $D_{f}=d_{f}$, we call this value the Darboux integral of $f$ over $[a, b]$, and denote it

$$
\int_{a}^{b} f(x) \mathrm{d} x=D_{f}=d_{f} .
$$

We say that $f$ is (Darboux-)integrable over $[a, b]$.
This is equivalent to the Riemann integral and to Riemann integrability.

## A few properties

If $f$ is continuous on $[a, b]$, then it is integrable on $[a, b]$.

## A few properties

If $f$ is continuous on $[a, b]$, then it is integrable on $[a, b]$.

Let $f$ be integrable on $[a, b]$ and on $[b, c]$ (with $a<b<c$ ).
We have that $f$ is integrable on $[a, c]$ and

$$
\int_{a}^{c} f(x) \mathrm{d} x=\int_{a}^{b} f(x) \mathrm{d} x+\int_{b}^{c} f(x) \mathrm{d} x .
$$

## Primitive function

Let $F(x)$ be a real function which is continuous on $[a, b]$ and differentiable on $(a, b)$.
Let $f(x)$ be a real function which is continuous on ( $a, b$ ) and such that

$$
\forall x \in(a, b), \quad F^{\prime}(x)=f(x)
$$

Such function $F$ is called a primitive function of $f$ on $(a, b)$.

## Primitive function

Let $F(x)$ be a real function which is continuous on $[a, b]$ and differentiable on $(a, b)$.
Let $f(x)$ be a real function which is continuous on $(a, b)$ and such that

$$
\forall x \in(a, b), \quad F^{\prime}(x)=f(x)
$$

Such function $F$ is called a primitive function of $f$ on $(a, b)$.

## Example

Find a primitive function on $(0,1)$ of the function $f(x)=2 x+x^{2}$.

## Newton's formula

Let $f$ be integrable on $[a, b]$ and $F(x)$ be (one of) its primitive function on $(a, b)$. We have

$$
\int_{a}^{b} f(x) \mathrm{d} x=[F(x)]_{a}^{b}=F(b)-F(a) .
$$

## Newton's formula

Let $f$ be integrable on $[a, b]$ and $F(x)$ be (one of) its primitive function on $(a, b)$. We have

$$
\int_{a}^{b} f(x) \mathrm{d} x=[F(x)]_{a}^{b}=F(b)-F(a) .
$$

## Example

Calculate $\int_{0}^{1}\left(2 x+x^{2}\right) d x$.

## Substitution

Let $\alpha, \beta \in \mathbb{R}$ such that $\alpha<\beta$.
Let $\varphi$ be a real function differentiable on $(\alpha, \beta)$ such that $\varphi$ and $\varphi^{\prime}$ are both continuous on $[\alpha, \beta]$.

Let $f$ be continuous on $[\varphi(\alpha), \varphi(\beta)]$ (or if $\varphi(\alpha) \leq \varphi(\beta)$, otherwise continuous on $[\varphi(\beta), \varphi(\alpha)])$.

If $f(\varphi(t)) \varphi^{\prime}(t)$ is integrable on $[\alpha, \beta]$, then

$$
\int_{\alpha}^{\beta} f(\varphi(t)) \varphi^{\prime}(t) \mathrm{d} t=\int_{\varphi(\alpha)}^{\varphi(\beta)} f(x) \mathrm{d} x
$$

## Substitution

Let $\alpha, \beta \in \mathbb{R}$ such that $\alpha<\beta$.
Let $\varphi$ be a real function differentiable on $(\alpha, \beta)$ such that $\varphi$ and $\varphi^{\prime}$ are both continuous on $[\alpha, \beta]$.

Let $f$ be continuous on $[\varphi(\alpha), \varphi(\beta)]$ (or if $\varphi(\alpha) \leq \varphi(\beta)$, otherwise continuous on $[\varphi(\beta), \varphi(\alpha)])$.

If $f(\varphi(t)) \varphi^{\prime}(t)$ is integrable on $[\alpha, \beta]$, then

$$
\int_{\alpha}^{\beta} f(\varphi(t)) \varphi^{\prime}(t) \mathrm{d} t=\int_{\varphi(\alpha)}^{\varphi(\beta)} f(x) \mathrm{d} x
$$

## Example

Calculate $\int_{1}^{2} \frac{2 \ln (t)^{2}}{t} \mathrm{~d} t$.

## Integration by parts

Let $f$ and $g$ be differentiable on $(a, b)$ and let $f, g, f^{\prime}, g^{\prime}$ be continuous on $[a, b]$. We have

$$
\int_{a}^{b} f^{\prime}(x) g(x) \mathrm{d} x=[f(x) g(x)]_{a}^{b}-\int_{a}^{b} f(x) g^{\prime}(x) \mathrm{d} x .
$$

## Integration by parts

Let $f$ and $g$ be differentiable on $(a, b)$ and let $f, g, f^{\prime}, g^{\prime}$ be continuous on $[a, b]$. We have

$$
\int_{a}^{b} f^{\prime}(x) g(x) \mathrm{d} x=[f(x) g(x)]_{a}^{b}-\int_{a}^{b} f(x) g^{\prime}(x) \mathrm{d} x
$$

## Example

Calculate $\int_{1}^{2} 10 x \ln x \mathrm{~d} x$.

## 2-variate function

Suppose we have a function $f: D \rightarrow \mathbb{R}$, where $D=[a, b] \times[c, d]$.

Imagine that this function represents (part of) a surface of some object. What is the volume of this object?

## Definition

Let $\Delta_{x}=\left(x_{i}\right)_{i=0}^{n}$ define a partition of $[a, b]$ and $\Delta_{y}=\left(y_{j}\right)_{j=0}^{m}$ a partition of $[c, d]$.
Then, $\Delta=\Delta_{x} \times \Delta_{y}$ defines a partitions of $D=[a, b] \times[c, d]$ into rectangles.

## Definition

Let $\Delta_{x}=\left(x_{i}\right)_{i=0}^{n}$ define a partition of $[a, b]$ and $\Delta_{y}=\left(y_{j}\right)_{j=0}^{m}$ a partition of $[c, d]$.
Then, $\Delta=\Delta_{x} \times \Delta_{y}$ defines a partitions of $D=[a, b] \times[c, d]$ into rectangles. Set

- $F_{\Delta, i, j}=\max \left\{f(x, y):(x, y) \in\left[x_{i-1}, x_{i}\right] \times\left[y_{j-1}, y_{j}\right]\right\}$ and
- $f_{\Delta, i, j}=\min \left\{f(x, y):(x, y) \in\left[x_{i-1}, x_{i}\right] \times\left[y_{j-1}, y_{j}\right]\right\}$.

## Definition

Let $\Delta_{x}=\left(x_{i}\right)_{i=0}^{n}$ define a partition of $[a, b]$ and $\Delta_{y}=\left(y_{j}\right)_{j=0}^{m}$ a partition of $[c, d]$.
Then, $\Delta=\Delta_{x} \times \Delta_{y}$ defines a partitions of $D=[a, b] \times[c, d]$ into rectangles. Set

- $F_{\Delta, i, j}=\max \left\{f(x, y):(x, y) \in\left[x_{i-1}, x_{i}\right] \times\left[y_{j-1}, y_{j}\right]\right\}$ and
- $f_{\Delta, i, j}=\min \left\{f(x, y):(x, y) \in\left[x_{i-1}, x_{i}\right] \times\left[y_{j-1}, y_{j}\right]\right\}$.

The upper Darboux sum of $f$ with respect to the partition $\Delta$ is

$$
S_{f, \Delta}=\sum_{i=1}^{n} \sum_{j=1}^{m} F_{\Delta, i, j} \cdot\left(x_{i}-x_{i-1}\right) \cdot\left(y_{j}-y_{j-1}\right)
$$

while the lower Darboux sum of $f$ with respect to the partition $\Delta$ is

$$
s_{f, \Delta}=\sum_{i=1}^{n} \sum_{j=1}^{m} f_{\Delta, i, j} \cdot\left(x_{i}-x_{i-1}\right) \cdot\left(y_{j}-y_{j-1}\right) .
$$

## Definition...

The upper Darboux integral (of $f$ over $D$ ) is

$$
D_{f}=\inf \left\{S_{f, \Delta}: \Delta \text { is a (rectangular) partition of } D\right\}
$$

and the lower Darboux integral (of $f$ over $D$ is

$$
d_{f}=\sup \left\{s_{f, \Delta}: \Delta \text { is a (rectangular) partition of } D\right\} .
$$

## Definition...

The upper Darboux integral (of $f$ over $D$ ) is

$$
D_{f}=\inf \left\{S_{f, \Delta}: \Delta \text { is a (rectangular) partition of } D\right\}
$$

and the lower Darboux integral (of $f$ over $D$ is

$$
d_{f}=\sup \left\{s_{f, \Delta}: \Delta \text { is a (rectangular) partition of } D\right\} .
$$

If $D_{f}=d_{f}$, we call this value the (double) Darboux integral of $f$ over $D$, and denote it

$$
\iint_{D} f(x, y) \mathrm{d} x \mathrm{~d} y=D_{f}=d_{f} .
$$

We say that $f$ is (Darboux-)integrable over $D$.

## How to calculate a double integral?

The following statement can be derived from the definition.

## Theorem

If $f$ is integrable over $D=[a, b] \times[c, d]$ and one of the integrals

$$
\int_{a}^{b}\left(\int_{c}^{d} f(x, y) \mathrm{d} y\right) \mathrm{d} x \text { or } \int_{c}^{d}\left(\int_{a}^{b} f(x, y) \mathrm{d} x\right) \mathrm{d} y
$$

exists, then it is equal to

$$
\iint_{D} f(x, y) \mathrm{d} x \mathrm{~d} y .
$$

## How to calculate a double integral?

The following statement can be derived from the definition.

## Theorem

If $f$ is integrable over $D=[a, b] \times[c, d]$ and one of the integrals

$$
\int_{a}^{b}\left(\int_{c}^{d} f(x, y) \mathrm{d} y\right) \mathrm{d} x \text { or } \quad \int_{c}^{d}\left(\int_{a}^{b} f(x, y) \mathrm{d} x\right) \mathrm{d} y
$$

exists, then it is equal to

$$
\iint_{D} f(x, y) \mathrm{d} x \mathrm{~d} y .
$$

## Example

Calculate the double integral over $D=[0,2] \times[-1,2]$ of the function $f(x, y)=x^{2} y+1$.

## And if $D$ is not a rectangle?

The definition is very similar: we approximate $D$ using smaller and smaller rectangular areas...

## Special types of domain $D(1 / 2)$

We will consider the following two types of the domain $D$.

- (type 1) $x \in[a, b]$ and $y$ is bounded by continuous functions $\varphi_{1}(x)$ and $\varphi_{2}(x)$;
- (type 2) $y \in[c, d]$ and $x$ is bounded by continuous functions $\psi_{1}(y)$ and $\psi_{2}(y)$.

## Special types of domain $D(2 / 2)$

Double integrals over such $D$ are calculated as follows.

## Theorem

If the integral on the right side exists, then we have (for such a domain $D$ ):

- if $D$ is of type 1 , then

$$
\iint_{D} f(x, y) \mathrm{d} x \mathrm{~d} y=\int_{a}^{b}\left(\int_{\varphi_{1}(x)}^{\varphi_{2}(x)} f(x, y) \mathrm{d} y\right) \mathrm{d} x
$$

- if $D$ is of type 2, then

$$
\iint_{D} f(x, y) \mathrm{d} x \mathrm{~d} y=\int_{c}^{d}\left(\int_{\psi_{1}(y)}^{\psi_{2}(y)} f(x, y) \mathrm{d} x\right) \mathrm{d} y .
$$

## Example

## Example

Let $D$ be the region given by the triangle with vertices $(0,1),(0,2)$ and $(3,0)$. Calculate

$$
\iint_{D} \frac{x+y}{2} \mathrm{~d} x \mathrm{~d} y .
$$

## Example

## Example

Let $D$ be the region given by the triangle with vertices $(0,1),(0,2)$ and $(3,0)$. Calculate

$$
\iint_{D} \frac{x+y}{2} \mathrm{~d} x \mathrm{~d} y .
$$

## Example

## Example

Let $D$ be the region given by the triangle with vertices $(0,1),(0,2)$ and $(3,0)$. Calculate

$$
\iint_{D} \frac{x+y}{2} \mathrm{~d} x \mathrm{~d} y .
$$

## Example

## Example

Let $D$ be the region given by the triangle with vertices $(0,1),(0,2)$ and $(3,0)$. Calculate

$$
\iint_{D} \frac{x+y}{2} \mathrm{~d} x \mathrm{~d} y .
$$
