3. Tree Sets

Let A be a finite set ordered by $<_1$ and $<_2$. An *interval exchange transformation* (IET) is a map $T : [0, 1[\rightarrow [0, 1[$ defined by

$$T(z) = z + \alpha_z \quad \text{if } z \in I_a.$$

$$a <_1 b <_1 c <_1 d$$

$$b <_2 c <_2 a <_2 d$$

A IET T is said to be *minimal* if for any $z \in [0, 1[$ the orbit $\mathcal{O}(z) = \{T^n(z) \mid n \in \mathbb{Z}\}$ is dense in $[0, 1[$.

T is said *regular* if the orbits of the separation points $\neq 0$ are infinite and disjoint.

Theorem [Keane, 1975]

A regular interval exchange transformation is minimal.

Let T be an IET relative to $(I_a)_{a \in A}$. The *natural coding* of T relative to $z \in [0, 1[$ is the infinite word $\Sigma_T(z) = a_0 a_1 \cdots \in A^\omega$ defined by

$$a_n = a \quad \text{si } T^n(z) \in I_a.$$

Example

The *Fibonacci word* is the natural coding of the rotation of angle $\alpha = (3 - \sqrt{5})/2$ relative to the point α , i.e. $T(z) = z + \alpha \bmod 1$.

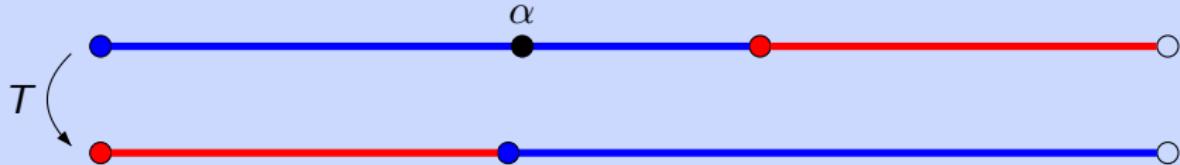

Let T be an IET relative to $(I_a)_{a \in A}$. The *natural coding* of T relative to $z \in [0, 1[$ is the infinite word $\Sigma_T(z) = a_0 a_1 \dots \in A^\omega$ defined by

$$a_n = a \quad \text{si } T^n(z) \in I_a.$$

Example

The *Fibonacci word* is the natural coding of the rotation of angle $\alpha = (3 - \sqrt{5})/2$ relative to the point α , i.e. $T(z) = z + \alpha \bmod 1$.

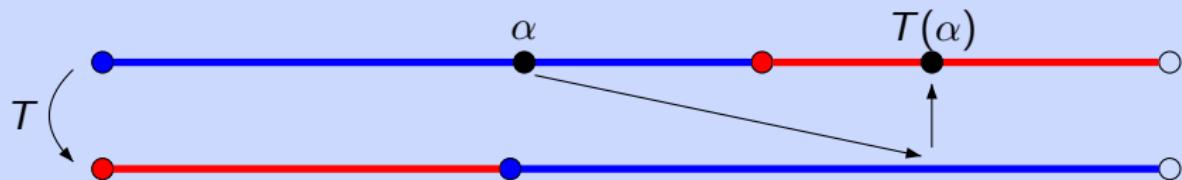

$$\Sigma_T(\alpha) = a$$

Let T be an IET relative to $(I_a)_{a \in A}$. The *natural coding* of T relative to $z \in [0, 1[$ is the infinite word $\Sigma_T(z) = a_0 a_1 \cdots \in A^\omega$ defined by

$$a_n = a \quad \text{si } T^n(z) \in I_a.$$

Example

The *Fibonacci word* is the natural coding of the rotation of angle $\alpha = (3 - \sqrt{5})/2$ relative to the point α , i.e. $T(z) = z + \alpha \bmod 1$.

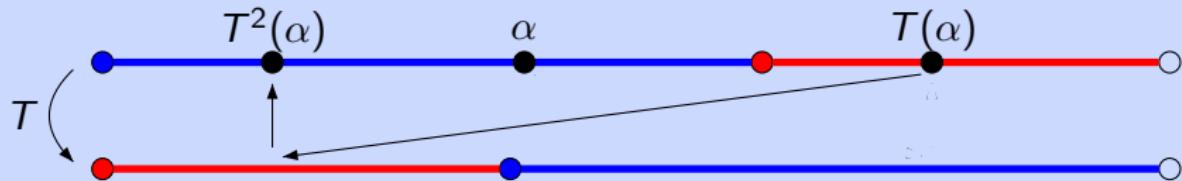

$$\Sigma_T(\alpha) = a b$$

Let T be an IET relative to $(I_a)_{a \in A}$. The *natural coding* of T relative to $z \in [0, 1[$ is the infinite word $\Sigma_T(z) = a_0 a_1 \dots \in A^\omega$ defined by

$$a_n = a \quad \text{si } T^n(z) \in I_a.$$

Example

The *Fibonacci word* is the natural coding of the rotation of angle $\alpha = (3 - \sqrt{5})/2$ relative to the point α , i.e. $T(z) = z + \alpha \bmod 1$.

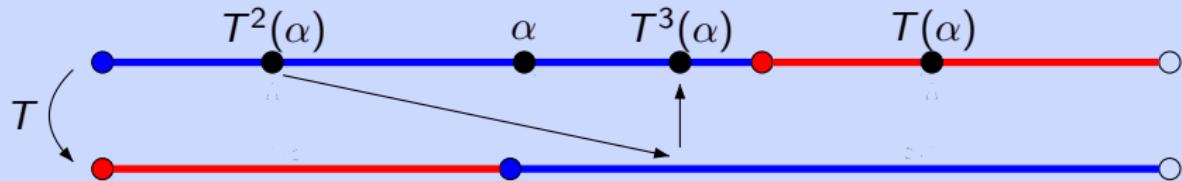

$$\Sigma_T(\alpha) = \textcolor{blue}{a} \textcolor{red}{b} \textcolor{blue}{a}$$

Let T be an IET relative to $(I_a)_{a \in A}$. The *natural coding* of T relative to $z \in [0, 1[$ is the infinite word $\Sigma_T(z) = a_0 a_1 \dots \in A^\omega$ defined by

$$a_n = a \quad \text{si } T^n(z) \in I_a.$$

Example

The *Fibonacci word* is the natural coding of the rotation of angle $\alpha = (3 - \sqrt{5})/2$ relative to the point α , i.e. $T(z) = z + \alpha \bmod 1$.

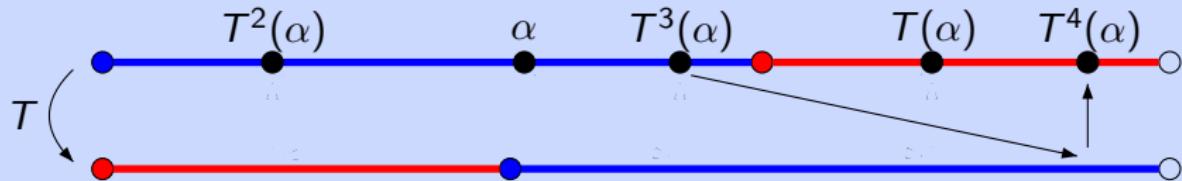

$$\Sigma_T(\alpha) = \textcolor{blue}{a} \textcolor{red}{b} \textcolor{blue}{a} \textcolor{blue}{a}$$

Let T be an IET relative to $(I_a)_{a \in A}$. The *natural coding* of T relative to $z \in [0, 1[$ is the infinite word $\Sigma_T(z) = a_0 a_1 \dots \in A^\omega$ defined by

$$a_n = a \quad \text{si } T^n(z) \in I_a.$$

Example

The *Fibonacci word* is the natural coding of the rotation of angle $\alpha = (3 - \sqrt{5})/2$ relative to the point α , i.e. $T(z) = z + \alpha \bmod 1$.

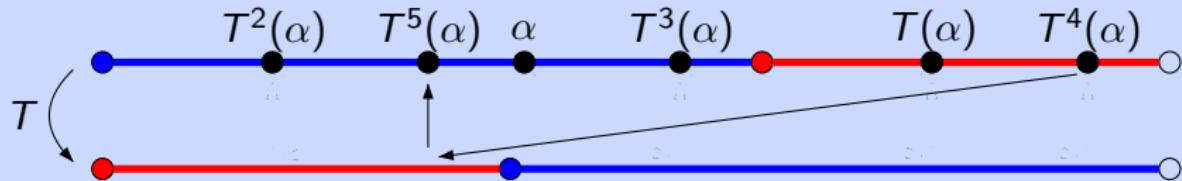

$$\Sigma_T(\alpha) = \textcolor{blue}{a} \textcolor{red}{b} \textcolor{blue}{a} \textcolor{blue}{a} \textcolor{red}{b}$$

Let T be an IET relative to $(I_a)_{a \in A}$. The *natural coding* of T relative to $z \in [0, 1[$ is the infinite word $\Sigma_T(z) = a_0 a_1 \dots \in A^\omega$ defined by

$$a_n = a \quad \text{si } T^n(z) \in I_a.$$

Example

The *Fibonacci word* is the natural coding of the rotation of angle $\alpha = (3 - \sqrt{5})/2$ relative to the point α , i.e. $T(z) = z + \alpha \bmod 1$.

$$\Sigma_T(\alpha) = \textcolor{blue}{a} \textcolor{red}{b} \textcolor{blue}{a} \textcolor{red}{a} \textcolor{blue}{b} \textcolor{red}{a} \cdots$$

Proposition

If T is minimal, $F(\Sigma_T(z))$ does not depend on z .

When T is regular (minimal), $F(T) = F(\Sigma_T(z))$ is said a *regular (minimal) interval exchange set*.

Example

The *Fibonacci set* is the set of factors of a natural coding of the rotation of angle $\alpha = (3 - \sqrt{5})/2$.

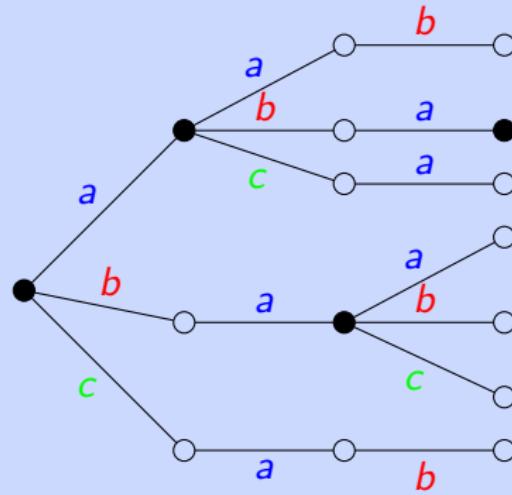

$$F(T) = \left\{ \varepsilon, a, b, aa, ab, ba, aab, aba, baa, \dots \right\}$$

Proposition

Sturmian sets over an alphabet of cardinality $n > 2$ are not regular interval exchange sets.

Example

The *Tribonacci set* is a Sturmian set.

Outline

1. Interval Exchange Sets

2. Interval Exchange and Codes

- o Codes
- o Cylinders
- o Bifix Codes and Interval Exchanges
- o Coding Morphism
- o Maximal Bifix Decoding

3. Tree Sets

A set $X \subset A^+$ of nonempty words over an alphabet A is a *code* if for every $m, n \geq 1$ and $x_1, \dots, x_n, y_1, \dots, y_m$,

$$x_1 \cdots x_n = y_1 \cdots y_m \implies n = m \text{ and } x_i = y_i \text{ for } i = 1, \dots, n.$$

A *prefix code* is a set of nonempty words which does not contain any proper prefix of its elements. A *suffix code* is defined symmetrically. A *bifix code* is a set which is both a prefix code and a suffix code.

Example

- $\{a, ab, ba\}$ is not a code.
- $\{aabbb, ababb, abb\}$ is a prefix code but it's not a suffix code.
- $\{aa, ab, ba\}$ is a bifix code.

A set $X \subset A^+$ of nonempty words over an alphabet A is a *code* if for every $m, n \geq 1$ and $x_1, \dots, x_n, y_1, \dots, y_m$,

$$x_1 \cdots x_n = y_1 \cdots y_m \implies n = m \text{ and } x_i = y_i \text{ for } i = 1, \dots, n.$$

A *prefix code* is a set of nonempty words which does not contain any proper prefix of its elements. A *suffix code* is defined symmetrically. A *bifix code* is a set which is both a prefix code and a suffix code.

Example

- $\{a, ab, ba\}$ is not a code.
- $\{aabbb, ababb, abb\}$ is a prefix code but it's not a suffix code.
- $\{aa, ab, ba\}$ is a bifix code.

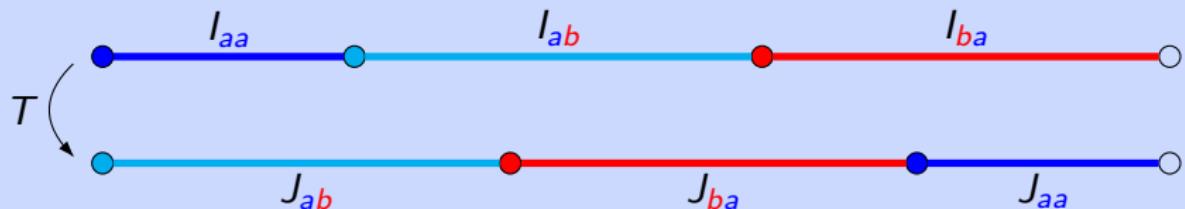

A bifix code $X \subset S$ is *S-maximal* if it is not properly contained in a bifix code $Y \subset S$.

For a word $w = b_0 b_1 \cdots b_{m-1}$, let's define

$$I_w = I_{b_0} \cap T^{-1}(I_{b_1}) \cap \dots \cap T^{-m+1}(I_{b_{m-1}})$$

and $J_w = T^m(I_w)$.

Example

$$I_{aa} = I_a \cap T^{-1}(I_a), \quad I_{ab} = I_a \cap T^{-1}(I_b), \quad I_{ba} = I_b \cap T^{-1}(I_a), \quad I_{bb} = I_b \cap T^{-1}(I_b);$$

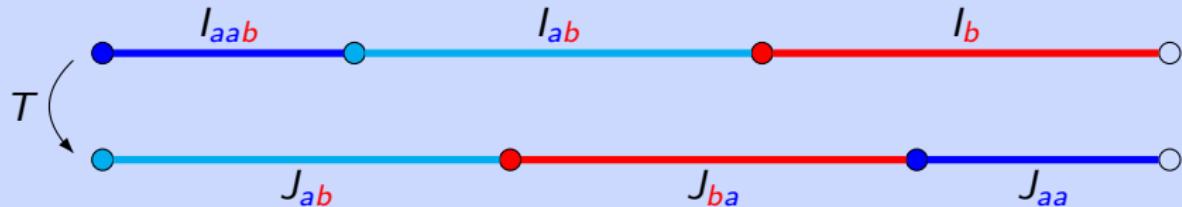

$$J_{aa} = T^2(I_a) \cap T(I_a), \quad J_{ab} = T^2(I_a) \cap T(I_b), \quad J_{ba} = T^2(I_b) \cap T(I_a), \quad J_{bb} = T^2(I_b) \cap T(I_b).$$

We denote by \prec_1 the lexicographic order on A^* induced by \prec_1 and by \prec_2 the lexicographic order on the reversal of the words induced by \prec_2 .

Proposition

- $I_u < I_v$ if and only if $u <_1 v$ and u is not a prefix of v .
 - $J_u < J_v$ if and only if $u <_2 v$ and u is not a suffix of v .

Example

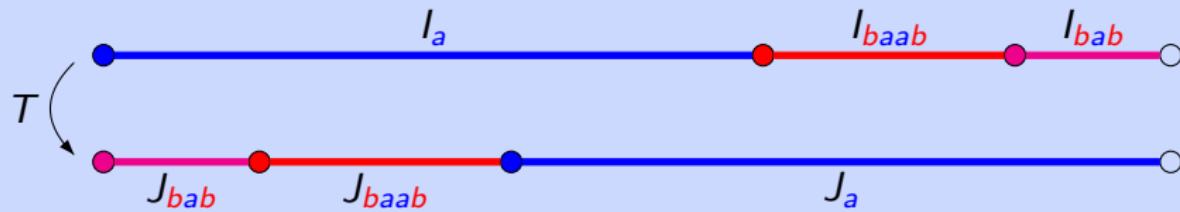

$$aab <_1 ab <_1 b \quad \text{while} \quad ab <_2 ba <_2 aa.$$

Proposition

Let T a minimal IET. If X is a finite $F(T)$ -maximal bifix code, the families $(I_w)_{w \in X}$ and $(J_w)_{w \in X}$ are ordered partitions of $[0, 1[$, relatively to the orders $<_1$ and $<_2$.

Example

Let S be the Fibonacci set. The set $X = \{a, baab, bab\}$ is an S -maximal bifix code.

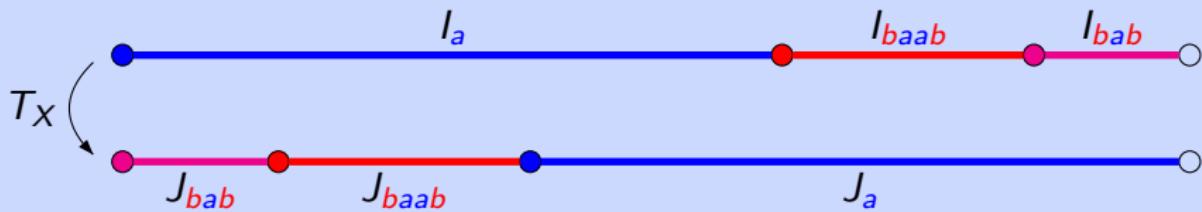

$$a <_1 baab <_1 bab \quad \text{and} \quad bab <_2 baab <_2 a.$$

Let T be a regular IET. Let X be a finite $F(T)$ -maximal bifix code on the alphabet A . Let's define the transformation

$$T_X(z) = T^{|u|}(z) \quad \text{if } z \in I_u.$$

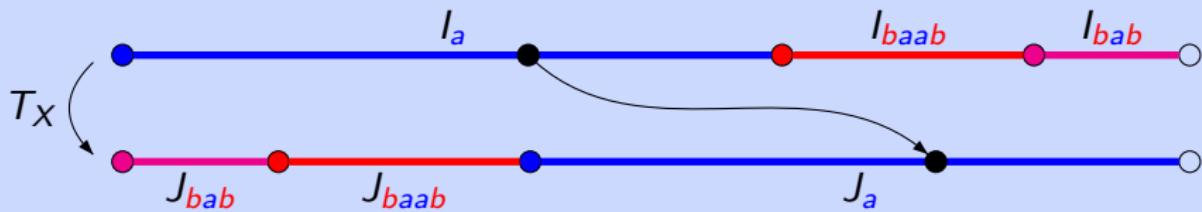

Example

Let T be a regular IET. Let X be a finite $F(T)$ -maximal bifix code on the alphabet A . Let's define the transformation

$$T_X(z) = T^{|u|}(z) \quad \text{if } z \in I_u.$$

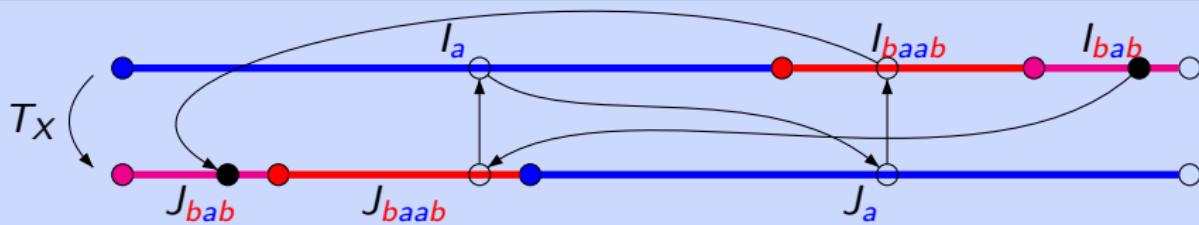

Example

Let T be a regular IET. Let X be a finite $F(T)$ -maximal bifix code on the alphabet A . Let's define the transformation

$$T_X(z) = T^{|u|}(z) \quad \text{if } z \in I_u.$$

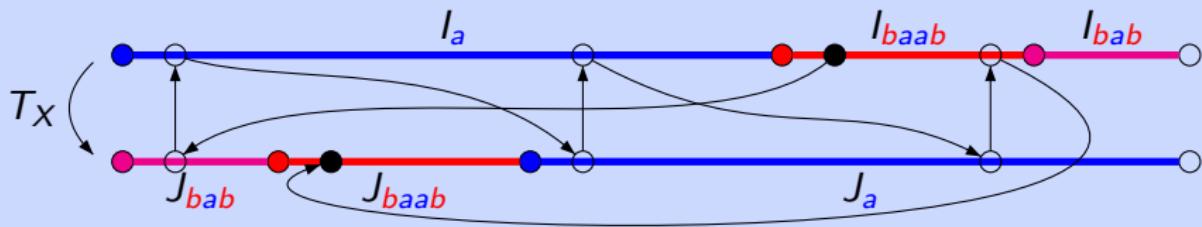

Example

Let T be a regular IET. Let X be a finite $F(T)$ -maximal bifix code on the alphabet A . Let's define the transformation

$$T_X(z) = T^{|u|}(z) \quad \text{if } z \in I_u.$$

Example

A *coding morphism* for a prefix code $X \subset A^+$ is a morphism $f : B^* \rightarrow A^*$ which maps bijectively B onto X .

Example

Let's consider the bifix code $X = \{aa, ab, ba\}$ on $A = \{a, b\}$ and let $B = \{u, v, w\}$.

The map

$$f : \begin{cases} u \mapsto aa \\ v \mapsto ab \\ w \mapsto ba \end{cases}$$

is a coding morphism for X .

Let $f : B^* \rightarrow A^*$ be a coding morphism for X . Let $(K_b)_{b \in B}$, with $K_b = I_{f(b)}$. Let T_f be the IET relative to $(K_b)_{b \in B}$.

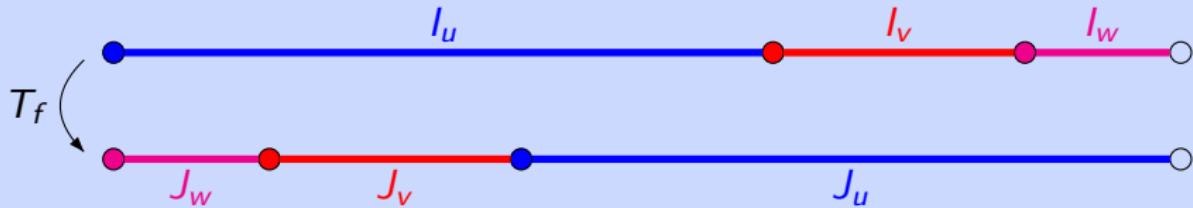

Proposition

If X is a finite $F(T)$ -maximal bifix code, one has $T_f = T_X$.

Example

Let $X = \{a, baab, bab\}$, $B = \{u, v, w\}$ and

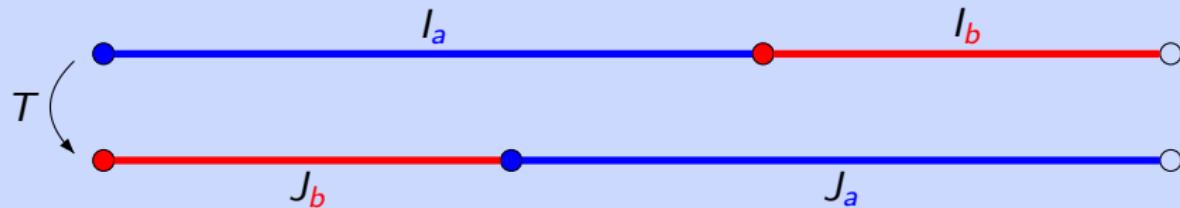

$$f : u \mapsto a, \quad v \mapsto baab, \quad w \mapsto bab.$$

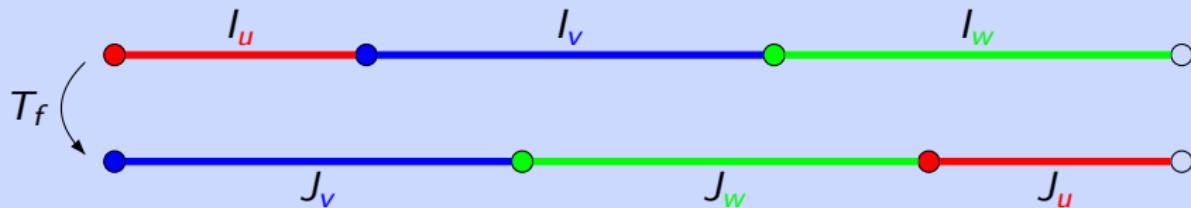

Theorem [2014]

Let T a regular IET. For any finite $F(T)$ -maximal bifix code X with coding morphism f , the transformation T_f is regular.

Example

$X = \{aa, ab, ba\}$ and $f : u \mapsto aa, v \mapsto ab, w \mapsto ba$.

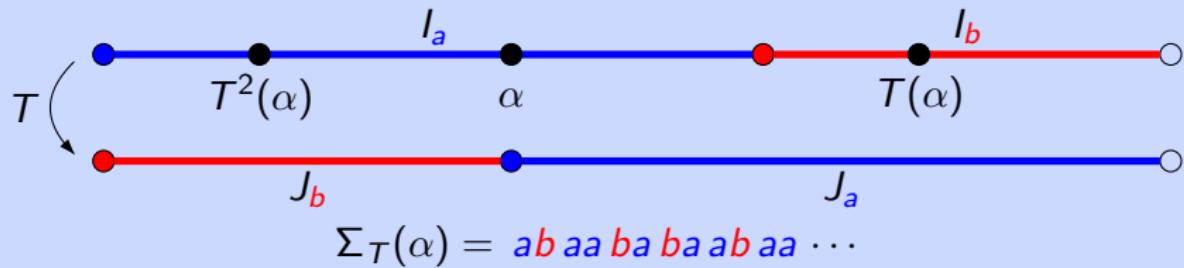

Let f be a coding morphism for a S -maximal prefix code. The *decoding* of x is the infinite word y s.t. $x = f(y)$.

Proposition

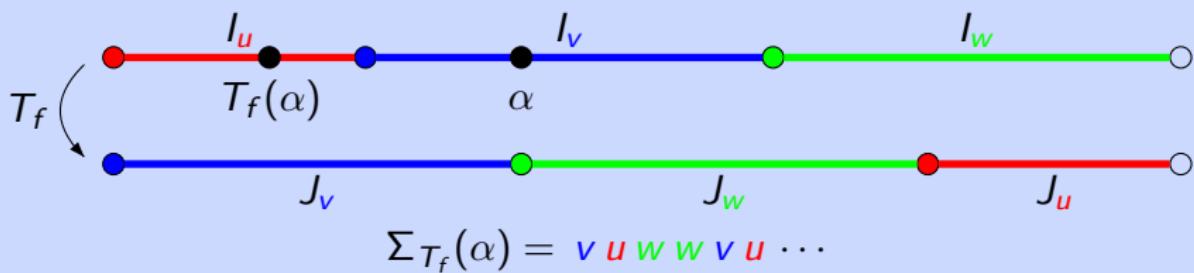

Let T be a minimal IET, X a finite $F(T)$ -maximal prefix code and $f : B^* \rightarrow A^*$ a coding morphism.

Then, for all $z \in [0, 1[$, one has $\Sigma_T(z) = f(\Sigma_{T_f}(z))$.

Example

$X = \{aa, ab, ba\}$ and $f : u \mapsto aa, v \mapsto ab, w \mapsto ba$.

$$f(v u w w v u \dots) = \underline{ab} \text{ } \underline{aa} \text{ } \underline{ba} \text{ } \underline{ba} \text{ } \underline{ab} \text{ } \underline{aa} \text{ } \underline{ba} \text{ } \underline{ba} \dots$$

Let f be a coding morphism for a finite S -maximal bifix code $X \subset S$.
The set $f^{-1}(S)$ is called a *maximal bifix decoding* of S .

Theorem [2014]

The family of regular interval exchange sets is closed under maximal bifix decoding.

Proof. $f^{-1}(S) = F(T_f)$.

Actually, this property is true for a larger class of sets...

Outline

1. Interval Exchange Sets
2. Interval Exchange and Codes
3. Tree Sets
 - o Extension Graphs
 - o Planar Tree sets
 - o Maximal Bifix Decoding

Let S be a biextendable set of words. For $w \in S$, we denote

$$L(w) = \{a \in A \mid aw \in S\}, \quad R(w) = \{a \in A \mid wa \in S\}$$

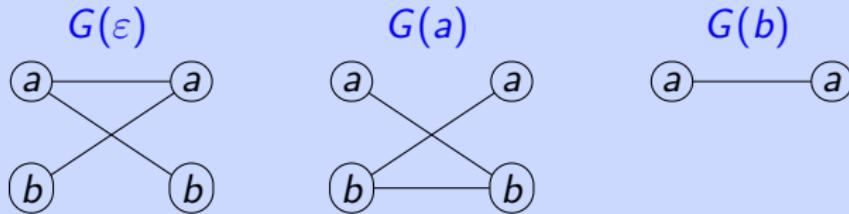

and

$$E(w) = \{(a, b) \in A \times A \mid awb \in S\}.$$

The *extension graph* of w is the undirected bipartite graph $G(w)$ with vertices $L(w) \sqcup R(w)$ and edges $E(w)$.

Example

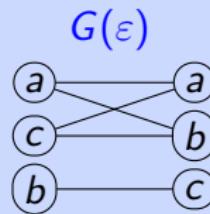

Let S be the Fibonacci set.

We say that a biextendable set S is a *tree set* if the graph $G(w)$ is a tree (connected and acyclic) for all $w \in S$.

Example

Let $A = \{a, b, c\}$. The set S of factors of $a^* \{bc, bcbc\} a^*$ is not a tree set.

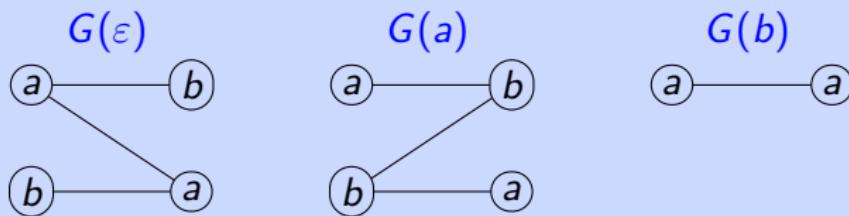

Let $<_1$ and $<_2$ be two orders on A . For a set S and a word $w \in S$, the graph $G(w)$ is *compatible* with $<_1$ and $<_2$ if for any $(a, b), (c, d) \in E(w)$, one has

$$a <_1 b \implies b \leq_2 d$$

Example

Let S be the Fibonacci set. Set $a <_1 b$ and $b <_2 a$.

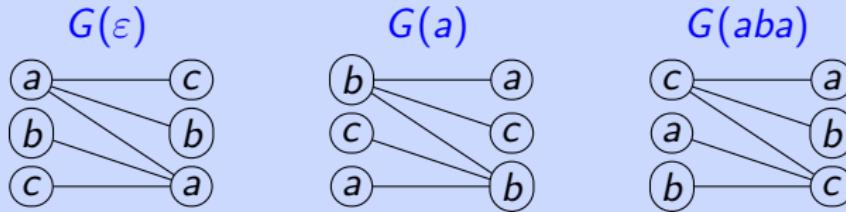

We say that a biextensible set S is a *planar tree set* w.r.t. $<_1$ and $<_2$ on A if for any $w \in S$, the graph $G(w)$ is a tree compatible with $<_1$ and $<_2$.

Example

Let $A = \{a, b, c\}$. The *Tribonacci set* is the set of factors of the Tribonacci word, i.e. is the fixpoint $x = f^\omega(a) = abacaba\dots$ of the morphism

$$f : a \mapsto ab, \quad b \mapsto ac, \quad c \mapsto a.$$

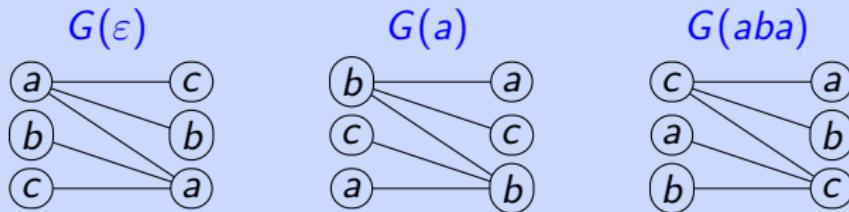

It is not possible to find two orders on A making the three graphs planar.

Example

Let $A = \{a, b, c\}$. The *Tribonacci set* is the set of factors of the Tribonacci word, i.e. is the fixpoint $x = f^\omega(a) = abacaba\dots$ of the morphism

$$f : a \mapsto ab, \quad b \mapsto ac, \quad c \mapsto a.$$

It is not possible to find two orders on A making the three graphs planar.

Theorem [Ferenczi, Zamboni, 2008]

A set S is a regular interval exchange set on A if and only if it is a uniformly recurrent planar tree set containing A .

Theorem [2014]

The family of uniformly recurrent tree set is closed under maximal bifix decoding.
